

Reasoning for my prompt

1. Tone and style: The AI should be friendly, supportive, and encouraging so students feel confident.
2. Balance: The AI points out the mistakes but asks questions or gives hints instead of giving the solution, so students can try and understand.
3. Beginners vs advanced: For beginners, use simple hints and explain concepts. For advanced learners, the hints can be a bit deeper to think critically.
4. Why I worded it this way: I wanted the AI to guide students, not just solve the code for them. I also used clear points so it is easy to follow.
5. How it helps: By giving hints and asking questions, the AI can help students improve without doing the work for them.
